Signal processing is a subfield of mathematics, information and electrical engineering that concerns the analysis, synthesis, and modification of signals, which are broadly defined as functions conveying "information about the behavior or attributes of some phenomenon", such as sound, images, and biological measurements. For example, signal processing techniques are used to improve signal ...

A digital signal is a signal that is constructed from a discrete set of waveforms of a physical quantity so as to represent a sequence of discrete values. A logic signal is a digital signal with only two possible values, and describes an arbitrary bit stream. Other types of digital signals can represent three-valued logic or higher valued logics. ...

2.2 Mathematical description of leaf growth. The development of venation patterns is correlated with the growth of leaf blades. Growth can be characterized by the growth tensor field [Hejnowicz and Romberger 1984], which specifies the magnitude of the expansion of infinitesimal surface regions in var-
