Lyme disease, or borreliosis, is caused by spirochetal bacteria from the genus *Borrelia*, which has 52 known species. Three main species (*Borrelia garinii*, *Borrelia afzelii*, and *Borrelia burgdorferi* s.s.) are the main causative agents of the disease in humans, while a number of others have been implicated as possibly pathogenic. *Borrelia* species in the species complex known to cause Lyme disease ...

Plant disease resistance protects plants from pathogens in two ways: by pre-formed structures and chemicals, and by infection-induced responses of the immune system. Relative to a susceptible plant, disease resistance is the reduction of pathogen growth on or in the plant (and hence a reduction of disease), while the term disease tolerance describes plants that exhibit little disease damage ...

Lyme disease is caused by the bacterium *Borrelia burgdorferi* and is transmitted to humans through the bite of infected blacklegged ticks. Typical symptoms include fever, headache, fatigue, and a characteristic skin rash called erythema migrans. If left untreated, infection can spread to joints, the heart, and the nervous system. Lyme disease is diagnosed based on symptoms, physical findings (e ...

In summary, host-microbe interactions can have health and disease promoting effects in the gut and also in distal organs ().The effects can be mediated by a plethora of microbe-derived effector molecules that include metabolites (SBA, SCFA), immune and inflammatory modulators PAMPs, MAMPs (microbe-associated molecular pattern), and secreted small natural products.

Exploring gut microbes in human health and disease

A network of disorders and disease genes linked by known disorderâ€“gene associations offers a platform to explore in a single graph-theoretic framework all known phenotype and disease gene associations, indicating the common genetic origin of many diseases. Genes associated with similar disorders ...
